Emily Ann Joseph

Activity 1 Reflection

This activity was all about getting back into Python basics, like working with variables and data types. Since I've used Zybooks before, a lot of this felt familiar, but it was still a good way to refresh my memory. The tasks were simple at first, like creating variables for my name and age. It was satisfying to see how quickly Python handles these things, and it reminded me why I like how straightforward coding can be.

The part that really tripped me up was trying to combine a string with a number. I kept getting an error, and for a minute, I felt like I was going in circles. It was frustrating because I thought I was doing everything right. After playing around with it, I realized I needed to convert the number into a string first. When it finally worked, it was such a relief. That little win felt good because I figured it out on my own, even if it took longer than I expected.

Overall, this activity wasn't super challenging, but it reminded me how important the basics are. Even though it was a refresher, it made me feel more confident in my coding skills. I know that understanding these small details will make a big difference when I tackle more complex projects later on. It's the little things, like solving an error, that remind me why I enjoy learning Pythom.
